Visual Analytics for the Direct Support of Value Assessment

Timos Kipouros

Abstract

In modern industries the design and optimisation in complex multidisciplinary design spaces is crucial. It is a process involving the simultaneous consideration of conflicting multiple criteria stemming from different domains and stakeholders. Computational models and simulations are utilised extensively, and multidimensional visualisation, as will be shown, can play a key role exploiting our fantastic pattern recognition ability in discovering relational information in such datasets and sequentially guiding the complex engineering design decisions. This will happen by identifying the connections between different stakeholder expectations and engineering technical properties satisfying a number of physical, geometrical, and any type of constraints. Though the examples are from the aerospace industry, the methodology is widely applicable.

Timos is a Senior Research Associate in the Engineering Design Centre at the University of Cambridge and the lead researcher in the Change Management and Computational Design groups. Timos is also a Lecturer in Computational Engineering Design Optimisation in Cranfield University. His primary research focus is in the areas of multi-physics optimisation methods, change propagation in engineering design, value driven design, interactive computational design, and multidimensional engineering data visualisation and analysis.
